 The invention provides a method for producing a Vibrio cholerae thyAnegative strain which is DeltathyA strain lacking thyA gene functions. The method comprises site-directed mutagenesis of the V. cholerae chromosome to delete and/or insert nucleotides at the thyA locus; The V. cholerae thyA-negative strains are used: for overproduction of recombinant proteins; and in vaccines to prevent or treat cholera (or other diseases if engineered to express the appropriate proteins). The thyA gene is also useful for insertion of foreign genes, in a selective and site-specific manner, and the proteins expressed by the thyA gene or by its 5' flanking region, are useful in research and as targets for
                                                                                                                                                                                       Claim
                                                                                                                                                                                                                  New Vibrio cholerae strain defective in the thyA vaccines and for recombinant protein production.
                                                                                                                                                                                                                                                                                 WPI; 2000-062719/05.

The thyA-negative strain can be maintained by thymine complementation, eliminating the need for antibiotic selection. The present sequence represents the nucleotide sequence of the V. cholerae thyA gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

New Vibrio cholerae strain defective in the thyA gene, vaccines and for recombinant protein production. for use 'n

Claim 11; Fig 3; 42pp; English

The invention provides a method for producing a Vibrio cholerae thyAnnegative strain which is DeltathyA strain lacking thyA gene functions. The method comprises site-directed mutagenesis of the V. cholerae chromosome to delete and/or insert nucleotides at the thyA locus; The V. cholerae thyA-negative strains are used: for overproduction of recombinant proteins; and in vaccines to prevent or treat cholera (or other diseases if engineered to express the appropriate proteins). The thyA gene is also useful for insertion of foreign genes, in a selective and site-specific manner, and the proteins expressed by the thyA gene or by its 5'-flanking region, are useful in research and as targets for antimicrobial therapy. When used for recombinant protein production, V. cholerae provides high yields with secretion of products into the culture medium for ease of subsequent recovery. The thyA-negative strain can be maintained by thymine complementation, eliminating the need for antibiotic selection. The present sequence represents the nucleotide sequence of the V. cholerae thyA gene 3' flanking region

```
(1) a vector occur imminist proliferation of a ceil. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
(C encoding a polypeptide whose expression is inhibited by the antisense
(C nucleic acid; (2) a host cell containing the vector; (3) an isolated
(C polypeptide or its fragment whose expression is inhibited by the
(C antisense nucleic acid; (4) an antibody capable of specifically binding
(C the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
(C proliferation; (7) identifying a compound that influences the activity of
(C proliferation; (7) identifying a compound that influences the activity of
(C proliferation; (7) identifying a compound that influences the activity of
(C proliferation of the test compound that influences the activity of
(C pathway in which the test compound that influences the activity of
(C pathway in which the test compound that inhibits proliferation of an
(C organism acts; (9) manufacturing an antibiotic; (10) profiling a
(C compound's activity; (11) a culture comprising strains in which the gene
(C product is overexpressed or underexpressed; (12) determining the extent
(C other heach of the strains is present in a culture or collection of
(C strains; or (13) identifying the target of a compound that inhibits the
(C required for proliferation to isolate candidate molecules for rational)
(C arguired for proliferation in cells other than S. aureus, S. typhimurium,
(K. pneumoniae or P. aeruginosa. The present sequence is one of the target
(C prokaryotic essential genes. Note: The sequence data for this patent did
(C electronic format directly from Menance
(C frin, which, which, which is here are an experience data for this patent did
(C electronic format directly from Menance
(C) the province in the printed specification, but was obtained in
06-SEP-2001;
25-OCT-2001;
08-FEB-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang

The invention relates to the production, from a non-toxigenic strain of V. cholerae, of attenuated strains of V. cholerae suitable for immunization against cholera. The attenuation comprises inactivating the gene for hemagglutinin protease (HP), either by deletion, insertion or some other defined and irreversible genetic manipulation. Additional biosafety of the attenuated strains is generated by mutating the thyA gene, resulting in auxotrophic mutants unable to replicate in the environment. The new strains are used to produce anticholera vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

New antisense nucleic acids, useful for identifying proteins or screening homologous nucleic acids required for cellular proliferation to late candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 40936; 1766pp; English.

cc encoding a polyophilde whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated containing the polypeptide or its fragment whose expression is inhibited by the containing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that inhibite scellular proliferation; (8) containing a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent contains; or (13) identifying the target of a compound that inhibits the contiferation of an organism. The antisense mucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational continuity of the proliferation in cells other than S. aureus, S. typhimurium, C. K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes, Note: The sequence data for this patent did celectronic format directly from WIPO at the printed specification, but was obtained in celectronic format directly from WIPO at the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: ftp.wipo.int/pub/published_pct_sequences (1) a vector comprising a promoter operably linked to the nucleic acid relates to an isolated nucleic acid comprising any one

Sequence BP; 217 A; 177 C; 216 G; 242 T; 0 U; 0 Other;

The invention provides a method for producing a Vibrio cholerae thyAnegative strain which is DeltathyA strain lacking thyA gene functions. The method comprises site-directed mutagenesis of the V. cholerae chromosome to delete and/or insert nucleotides at the thyA locus; The cholerae thyA-negative strains are used: for overproduction of recombinant proteins; and in vaccines to prevent or treat cholera (or
                                                                                                                                                   Claim 10;
                                                                                                                                                                                        New Vibrio cholerae strain defective in the thyA vaccines and for recombinant protein production.
                                                                                                                                                                                                                                                                                                                                                                                                                                               21-MAY-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            other diseases if engineered to express the appropriate proteins). The thyA gene is also useful for insertion of foreign genes, in a selective and site-specific manner, and the proteins expressed by the thyA gene or by its 5'.flanking region, are useful in research and as trargets for antimicrobial therapy. When used for recombinant protein production, v. cholerae provides high yields with secretion of products into the culture medium for ease of subsequent recovery. The thyA-negative strain can be maintained by thymine complementation, eliminating the need for antibiotic selection. The present sequence represents the nucleotide sequence of the V. cholerae thyA gene 5' flanking region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 838 BP; 145 A; 176 C;
